1. Realization using K-Maps
You can obtain 2-level logic using K-Maps.

∴ F K-Map-MSOP = AB + A /D + B /D + C

∴ F K-Map-MPOS = (A+B+C) (A+C+/D) (B+C+/D)

2. Realization using MUXes
From the K-Map or Truth table (or equation):
• when C D = 0 0, F = A + B
• when C D = 0 1, F = A • B
• when C D = 1 0, F = 1
• when C D = 1 1, F = 1

4. Realization using ROM or EPROM or EEPROM (or RAM)
Design using 2716, a 2K x 8 EPROM
Constraints (to make it realistic): Suppose we are already using 75% of the EPROM, that is, from addresses 0_{10}~1535_{10} (1K+512 bytes)
000 0000 0000 0_{10} = 000_{16}
101 1111 1111 1535_{10} = $5FF_{16}$ = $5FF
∴ $600 - $7FF (upper 512 bytes) are not used.
We just need to find a 16 byte contiguous block to accommodate F, such that the address lines become ABCD in the Truth Table.
